

Combination of dynamometers for testing automotive drives

Proven modules

- MP dynamometers
- RWB mobile operation trolley as engine support
- control equipment with MP Computer

New application

- testing of the complete drive system
- no problems with adapting the engine to the dynamometers
- simulation of driving curves by input of desired speed ratio
- permanent high-power tests with passenger car drives

Further possible applications

- complete vehicle instead of the drive unit
- four dynamometers for testing all-wheel-drives
- other types of dynamometers

RWB mobile operation trolley

for mounting the complete drive system:

- The engine and the drive system flanged to it can and should be fixed with their original supports.
- The positioning of operation panel and gas lever should permit an operation of the clutch-pedal and gear-lever in the usual manner.
